

Assignment: Movie Review Analyzer

Date: 26/03/2026

Name: Aashish Chaudhary

Objective

To build a simple sentiment analysis system that classifies movie reviews as Positive or Negative.

Reviews Used

This movie was amazing and very entertaining
I did not like the film, it was boring
shaandar movie, I loved it
The story was dull and slow
Great acting and wonderful direction

Methodology

Use Natural Language Processing (NLP)
Apply TextBlob for sentiment analysis
Calculate polarity score:
Positive → > 0
Negative → < 0
Neutral → = 0

Python Code

```
from textblob import TextBlob
# List of reviews
reviews = [
    "This movie was amazing and very entertaining",
    "I did not like the film, it was boring",
    "Shandaar movie, I loved it",
    "The story was dull and slow",
    "Great acting and wonderful direction"
]

# Analyze sentiment
for review in reviews:
    analysis = TextBlob(review)
    polarity = analysis.sentiment.polarity

    if polarity > 0:
        sentiment = "Positive"
    elif polarity < 0:
        sentiment = "Negative"
    else:
        sentiment = "Neutral"

    print(f"Review: {review}")
    print(f"Sentiment: {sentiment}\n")
```

Explanation

The model uses polarity score to determine sentiment. Words like amazing, great give positive scores, while boring, dull give negative scores.

Conclusion

This project demonstrates how sentiment analysis can classify text automatically. It is useful in analyzing customer reviews, feedback, and opinions.
